Assignment 6A - Reflection

Jeremia Lo | jeremial

This assignment was pretty confusing at first, but the lab today helped greatly. The main thing I focused on for this assignment was to locally store user input across pages so that the final appointment page would show the user the number of upcoming appointments. Currently it only shows the most recently added appointment, but I plan on adjusting the design to be closer to my hi-fi prototype in the next assignment, for both the time selection page and the appointment page. The main bug I ran into related to the interaction between global and local variables when updating the appointment list, so that's definitely something I can keep in mind for future assignments.
